

Exhibit 2 to Complaint Intellectual Ventures II LLC

Example Southwest Count I Systems and Services
U.S. Patent No. 7,822,841 (“the ’841 Patent”)

The Accused Systems and Services include without limitation Southwest systems and services that utilize Kubernetes; all past, current, and future systems and services that operate in the same or substantially similar manner as the specifically identified systems and services; and all past, current, and future Southwest systems and services that have the same or substantially similar features as the specifically identified systems and services (“Example Southwest Count I Systems and Services” or “Southwest Systems and Services”).¹

On information and belief, the Southwest Systems and Services use Kubernetes in Southwest’s private cloud(s). For example, Southwest posts, or has posted, job opportunities that require familiarity with Kubernetes concepts.

See <https://www.linkedin.com/in/madhuker-daraboina-0038001a5/>, job profile of Senior DevOps/Cloud Engineer stating use of Kubernetes. (Last accessed on 9/24/2024).

See <https://www.linkedin.com/in/abhijitroy18/>, job profile of Platform engineer stating use of Kubernetes. (Last accessed on 9/24/2024).

See <https://www.linkedin.com/in/hammad--raza/>, job profile of senior security engineer stating use of Kubernetes. (Last accessed on 9/24/2024).

See <https://www.linkedin.com/in/saikumar-kada-a8b884135/>, job profile of senior tech ops Engineer listing Kubernetes as a skill for Southwest position. (Last accessed on 9/24/2024).

As another example, Southwest has stated that it is investing in cloud technology and has “moved about 50% of its technology” to the cloud and has indicated cloud migration is one of its areas of focus for 2024 and beyond.

Source: <https://www.phocuswire.com/southwest-airlines-cio-tech-investment>.

On information and belief, other information confirms Southwest uses Kubernetes technology.

¹ For the avoidance of doubt, Plaintiff does not accuse the public clouds of Defendant, to the extent those services are provided by a cloud provider with a license to Plaintiff’s patent that covers Defendant’s activities. Plaintiff does not accuse the public clouds of Defendant if those services are provided by a cloud provider with a license to Plaintiff’s patent that covers Defendant’s activities. Plaintiff will produce relevant license agreements in this litigation. Plaintiff accuses Defendant’s private clouds that implement Kubernetes and non-licensed public clouds that Defendant uses to support Kubernetes for its systems and services. Plaintiff will provide relevant license agreements for cloud providers in discovery, to the extent any such license agreements have not already been produced. To the extent any of these licenses are relevant to Defendant’s activities, Plaintiff will meet and confer with Defendant about the impact of such license(s). Once a protective order is entered into the case, Plaintiff will provide further details.

U.S. Patent No. 7,822,841 (Claim 1)	
Patent Claim	Example Southwest Count I Systems and Services
1[Pre] A computer system for hosting computing clusters for clients, comprising:	<p>To the extent this preamble is limiting, on information and belief, the Southwest Count I Systems and Services utilizes a computer system capable of hosting computing clusters for clients.</p> <p>Kubernetes deployed on a server system is a portable, extensible platform for managing containerized workloads and services.</p> <h2>Overview</h2> <p>Kubernetes is a portable, extensible, open source platform for managing containerized workloads and services, that facilitates both declarative configuration and automation. It has a large, rapidly growing ecosystem. Kubernetes services, support, and tools are widely available.</p> <p>Source: https://kubernetes.io/docs/concepts/overview/.</p> <p>Further, Kubernetes uses clusters, which are groups of nodes (for example, node 1 and node 2) that host and run containerized applications as per their defined deployments and services.</p>

U.S. Patent No. 7,822,841 (Claim 1)	
Patent Claim	Example Southwest Count I Systems and Services
	<h2>Cluster Architecture</h2> <p>The architectural concepts behind Kubernetes.</p> <p>A Kubernetes cluster consists of a control plane plus a set of worker machines, called nodes, that run containerized applications. Every cluster needs at least one worker node in order to run Pods.</p> <p>The worker node(s) host the Pods that are the components of the application workload. The control plane manages the worker nodes and the Pods in the cluster. In production environments, the control plane usually runs across multiple computers and a cluster usually runs multiple nodes, providing fault-tolerance and high availability.</p> <p>Source: https://kubernetes.io/docs/concepts/architecture/.</p>

U.S. Patent No. 7,822,841 (Claim 1)

Patent Claim

Example Southwest Count I Systems and Services

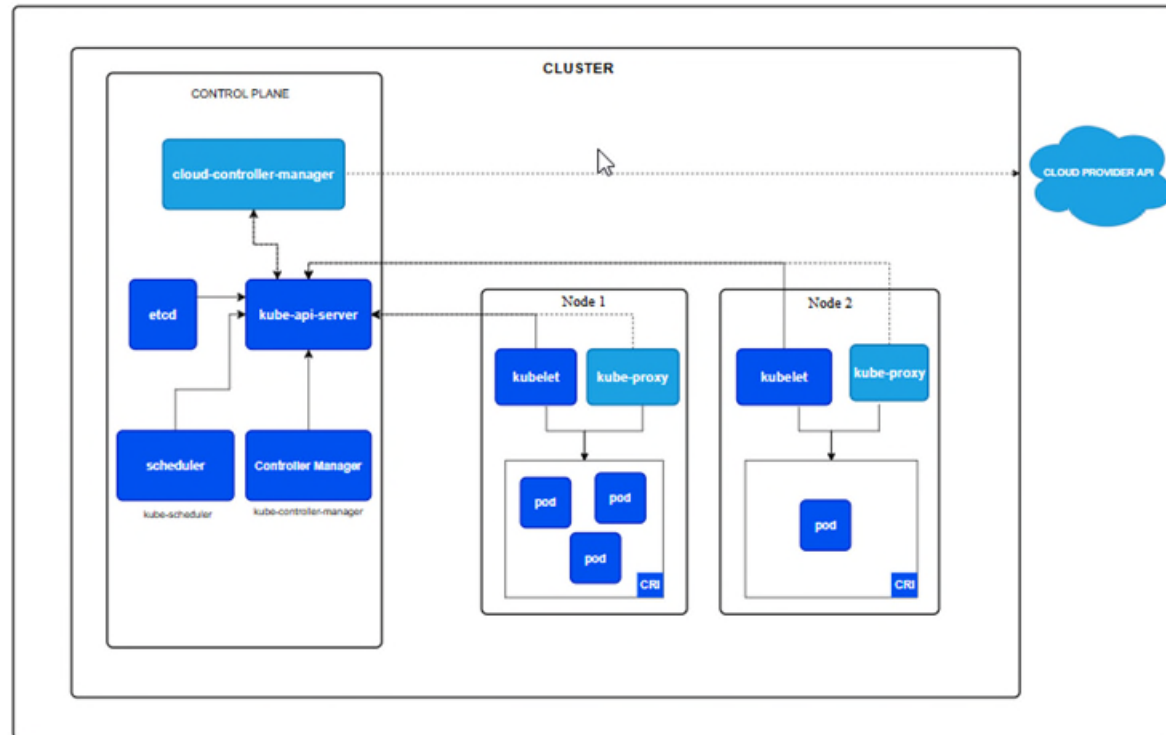

Figure 1. Kubernetes cluster components.

Source: <https://kubernetes.io/docs/concepts/architecture/>.

As shown below, Kubernetes supports multiple clusters, which can be hosted on a computer system.

Kubernetes is designed to scale quickly, massively, and reliably. However, scaling in place — such as adding more nodes to a cluster — eventually reaches a point of diminishing returns. Kubernetes multi-cluster, which is multiple Kubernetes clusters operating as a single logical platform, helps solve this problem and enhances Kubernetes capabilities in many critical areas.

U.S. Patent No. 7,822,841 (Claim 1)	
Patent Claim	Example Southwest Count I Systems and Services
	<h2>Define clusters, users, and contexts</h2> <p>Suppose you have two clusters, one for development work and one for test work. In the <code>development</code> cluster, your frontend developers work in a namespace called <code>frontend</code>, and your storage developers work in a namespace called <code>storage</code>. In your <code>test</code> cluster, developers work in the default namespace, or they create auxiliary namespaces as they see fit. Access to the development cluster requires authentication by certificate. Access to the test cluster requires authentication by username and password.</p> <p>Source: https://kubernetes.io/docs/tasks/access-application-cluster/configure-access-multiple-clusters/.</p>
1[a] a private communications network linked to a public communications network;	<p>Based on information and belief, the Southwest Count I Systems and Services includes a private communications network linked to a public communications network.</p> <p>For example, the Kubernetes system within the Southwest accused network is configured to be linked through, for example, an Ingress, to an external network such as the Internet.</p>

U.S. Patent No. 7,822,841 (Claim 1)	
Patent Claim	Example Southwest Count I Systems and Services
	<h2>Terminology</h2> <p>For clarity, this guide defines the following terms:</p> <ul style="list-style-type: none"> • Node: A worker machine in Kubernetes, part of a cluster. • Cluster: A set of Nodes that run containerized applications managed by Kubernetes. For this example, and in most common Kubernetes deployments, nodes in the cluster are not part of the public internet. • Edge router: A router that enforces the firewall policy for your cluster. This could be a gateway managed by a cloud provider or a physical piece of hardware. • Cluster network: A set of links, logical or physical, that facilitate communication within a cluster according to the Kubernetes networking model. • Service: A Kubernetes <u>Service</u> that identifies a set of Pods using <u>label</u> selectors. Unless mentioned otherwise, Services are assumed to have virtual IPs only routable within the cluster network. <p>Source: https://kubernetes.io/docs/concepts/services-networking/ingress/.</p> <h2>The Kubernetes network model</h2> <p>...</p>

U.S. Patent No. 7,822,841 (Claim 1)	
Patent Claim	Example Southwest Count I Systems and Services
	<ul style="list-style-type: none"> • The <i>pod network</i> (also called a cluster network) handles communication between pods. It ensures that (barring intentional network segmentation): <ul style="list-style-type: none"> ◦ All pods can communicate with all other pods, whether they are on the same node or on different nodes. Pods can communicate with each other directly, without the use of proxies or address translation (NAT). <p>On Windows, this rule does not apply to host-network pods.</p> <ul style="list-style-type: none"> ◦ Agents on a node (such as system daemons, or kubelet) can communicate with all pods on that node. <p>Source: https://kubernetes.io/docs/concepts/services-networking/.</p> <p>Further, in Kubernetes, Services provide a way for communication within the Southwest accused network to an external network, such as the Internet. For example, the Ingress is configured to expose HTTP/HTTPS routes from outside the cluster.</p> <p>In Kubernetes, you generally need to use a Service to expose an application in your cluster to the internet. A service groups together pods performing the same function (e.g. running the same application) and defines how to access them.</p> <p>The most basic type of service is clusterIP, but this only provides internal access, from within the cluster, to the defined pods. The NodePort and LoadBalancer services both provide external access. Ingress (which is not a service but an API object inside a cluster) combined with an explicitly-created ingress controller is another way to expose the cluster.</p> <p>Source: https://www.scaleway.com/en/docs/kubernetes/reference-content/exposing-services/.</p>

U.S. Patent No. 7,822,841 (Claim 1)	
Patent Claim	Example Southwest Count I Systems and Services
	<h2>Service</h2> <p>Expose an application running in your cluster behind a single outward-facing endpoint, even when the workload is split across multiple backends.</p> <p>In Kubernetes, a Service is a method for exposing a network application that is running as one or more Pods in your cluster.</p> <p>Source: https://kubernetes.io/docs/concepts/services-networking/service/.</p> <p>A key aim of Services in Kubernetes is that you don't need to modify your existing application to use an unfamiliar service discovery mechanism. You can run code in Pods, whether this is a code designed for a cloud-native world, or an older app you've containerized. You use a Service to make that set of Pods available on the network so that clients can interact with it.</p> <p>Source: https://kubernetes.io/docs/concepts/services-networking/service/.</p>

U.S. Patent No. 7,822,841 (Claim 1)	
Patent Claim	Example Southwest Count I Systems and Services
	<h2>Services in Kubernetes </h2> <p>The Service API, part of Kubernetes, is an abstraction to help you expose groups of Pods over a network. Each Service object defines a logical set of endpoints (usually these endpoints are Pods) along with a policy about how to make those pods accessible.</p> <p>Source: https://kubernetes.io/docs/concepts/services-networking/service/.</p> <p>If your workload speaks HTTP, you might choose to use an Ingress to control how web traffic reaches that workload. Ingress is not a Service type, but it acts as the entry point for your cluster. An Ingress lets you consolidate your routing rules into a single resource, so that you can expose multiple components of your workload, running separately in your cluster, behind a single listener.</p> <p>Source: https://kubernetes.io/docs/concepts/services-networking/service/.</p> <p>Ingress exposes HTTP and HTTPS routes from outside the cluster to services within the cluster. Traffic routing is controlled by rules defined on the Ingress resource.</p> <p>Source: https://kubernetes.io/docs/concepts/services-networking/ingress/.</p>

U.S. Patent No. 7,822,841 (Claim 1)

Patent Claim

Example Southwest Count I Systems and Services

Figure. Ingress

Source: <https://kubernetes.io/docs/concepts/services-networking/ingress/>.

A Kubernetes system from within the Southwest accused network includes the Gateway API, which provides Gateway resources. These resources can be defined and specified so that external traffic from the Internet can be routed to various Services.

- The [Gateway](#) API (or its predecessor, [Ingress](#)) allows you to make Services accessible to clients that are outside the cluster.

Source: <https://kubernetes.io/docs/concepts/services-networking/>.

The [Gateway](#) API for Kubernetes provides extra capabilities beyond Ingress and Service. You can add Gateway to your cluster - it is a family of extension APIs, implemented using [CustomResourceDefinitions](#) - and then use these to configure access to network services that are running in your cluster.

Source: <https://kubernetes.io/docs/concepts/services-networking/service/>.

U.S. Patent No. 7,822,841 (Claim 1)	
Patent Claim	Example Southwest Count I Systems and Services
	<h2>Resource model</h2> <p>Gateway API has three stable API kinds:</p> <ul style="list-style-type: none"> • GatewayClass: Defines a set of gateways with common configuration and managed by a controller that implements the class. • Gateway: Defines an instance of traffic handling infrastructure, such as cloud load balancer. • HTTPRoute: Defines HTTP-specific rules for mapping traffic from a Gateway listener to a representation of backend network endpoints. These endpoints are often represented as a <u>Service</u>. <p>Source: https://kubernetes.io/docs/concepts/services-networking/gateway/.</p>  <pre> graph LR client((client)) -.-> HTTP request Gateway[Gateway] Gateway --> HTTPRoute[HTTPRoute] HTTPRoute -- "Routing rule" --> Service[Service] Service --> Pod1[Pod] Service --> Pod2[Pod] </pre> <p>In this example, the request flow for a Gateway implemented as a reverse proxy is:</p> <ol style="list-style-type: none"> 1. The client starts to prepare an HTTP request for the URL <code>http://www.example.com</code> <p>Source: https://kubernetes.io/docs/concepts/services-networking/gateway/.</p>
1[b] a first cluster comprising a set of computing resources, including at least one hardware processor, in a first	Based on information and belief, the Southwest Count I Systems and Services include a first cluster comprising a set of computing resources, including at least one hardware processor, in a first configuration, wherein the first cluster is communicatively linked to the private communications network.

U.S. Patent No. 7,822,841 (Claim 1)	
Patent Claim	Example Southwest Count I Systems and Services
configuration, wherein the first cluster is communicatively linked to the private communications network;	<p>For example, Kubernetes supports a Kubernetes cluster network to facilitate communication amongst nodes and/or Pods within the Southwest accused network.</p> <p>For example, Kubernetes clusters include at least one node, where a node is either a physical or virtual machine comprising a CPU or portion of CPU resources and memory, to run workloads. These clusters are connected to a private network, for example, the Southwest accused network. On information and belief, the private network, for example, the Southwest accused network, facilitates container-to-container, Pod-to-Pod, and/or Pod-to-Services communications across multiple clusters for sharing data and handling tasks.</p> <h3>Cluster Architecture</h3> <p>The architectural concepts behind Kubernetes.</p> <p>A Kubernetes cluster consists of a control plane plus a set of worker machines, called nodes, that run containerized applications. Patent Claim

Example Southwest Count I Systems and Services

Source: <https://www.groundcover.com/kubernetes-monitoring>.

Also, Kubernetes provides a full metrics pipeline and monitoring pipeline feature that provides monitoring of operations within Kubernetes clusters.

U.S. Patent No. 7,822,841 (Claim 1)	
Patent Claim	Example Southwest Count I Systems and Services
	<p>A full metrics pipeline gives you access to richer metrics. Kubernetes can respond to these metrics by automatically scaling or adapting the cluster based on its current state, using mechanisms such as the Horizontal Pod Autoscaler. The monitoring pipeline fetches metrics from the kubelet and then exposes them to Kubernetes via an adapter by implementing either the <code>custom.metrics.k8s.io</code> or <code>external.metrics.k8s.io</code> API.</p> <p>Kubernetes is designed to work with OpenMetrics, which is one of the CNCF Observability and Analysis - Monitoring Projects, built upon and carefully extending Prometheus exposition format in almost 100% backwards-compatible ways.</p> <p>Source: https://kubernetes.io/docs/tasks/debug/debug-cluster/resource-usage-monitoring/.</p> <h2>What is Kubernetes monitoring?</h2> <p>Simply put, Kubernetes monitoring is the practice of tracking the status of all components of a Kubernetes environment. Because there are many pieces inside Kubernetes, Kubernetes monitoring actually entails monitoring many distinct things, such as:</p> <ul style="list-style-type: none"> • The kube-system workloads. • Cluster information using the Kubernetes API. • Applications interactions with Kubernetes by monitoring apps bottom-up. <p>Source: https://www.groundcover.com/kubernetes-monitoring.</p> <p>Further, Kubernetes monitoring includes providing alerts to problems occurring within a cluster that enables troubleshooting and addressing other potential issues.</p>

U.S. Patent No. 7,822,841 (Claim 1)	
Patent Claim	Example Southwest Count I Systems and Services
	<p>By collecting Kubernetes data, you'll get viable information regarding your Kubernetes cluster health, that can help you perform Kubernetes troubleshooting and manage issues like unexpected container termination. You can also leverage the data for proactive decisions such as adjusting rate limits.</p> <p>Source: https://www.groundcover.com/kubernetes-monitoring.</p> <p>Kubernetes alerting is the practice of generating notifications for events or trends in Kubernetes that require admins' attention. Examples of such events and trends include:</p> <ul style="list-style-type: none"> • A node that has failed. • A Pod that is stuck in the pending state. • A container or Pod that is consuming a high level of resources relative to normal consumption trends. • High latency rates for communication between Kubernetes cluster components (such as between kubelet and control plane nodes). <p>Source: https://www.groundcover.com/kubernetes-monitoring/kubernetes-alerting.</p> <p>Further, Kubernetes using API for cluster monitoring and kubelets for monitoring at node level, Kubernetes also supports additional third-party open source monitoring tools such as, Grafana, Prometheus, and/or FluentD.</p>

U.S. Patent No. 7,822,841 (Claim 1)	
Patent Claim	Example Southwest Count I Systems and Services
	<h2>Setting up monitoring in Kubernetes</h2> <p>Monitoring is a crucial aspect of effectively managing Kubernetes clusters. By setting up comprehensive monitoring, you can gain insights into your cluster's health, performance, and resource utilization, enabling you to address issues and optimize your infrastructure proactively. Several monitoring solutions are available for Kubernetes, including open-source tools like Prometheus, Grafana, and Alertmanager and commercial options like Datadog and New Relic.</p> <p>Choose a solution that aligns with your requirements and budget. Setting up Prometheus and Grafana for monitoring your Kubernetes cluster is a common choice and can provide a robust monitoring solution. The following are detailed steps for setting up Prometheus, Grafana, and FluentD, three common monitoring components, assuming that a Kubernetes cluster is already up and running:</p> <ul style="list-style-type: none"> ■ Prometheus: A monitoring tool built for aggregating metrics in containers that can be used for setting up alerts. ■ Grafana: A monitoring tool that can be used to visualize Prometheus data. ■ FluentD: A tool for aggregating a system's logs into one source. <p>Source: https://www.apptio.com/topics/kubernetes/monitoring/.</p>

Pods

Pods are the smallest deployable units of computing that you can create and manage in Kubernetes.

A *Pod* (as in a pod of whales or pea pod) is a group of one or more containers, with shared storage and network resources, and a specification for how to run the containers. A Pod's contents are always co-located and co-scheduled, and run in a shared context. A Pod models an application-specific "logical host": it contains one or more application containers which are relatively tightly coupled. In non-cloud contexts, applications executed on the same physical or virtual machine are analogous to cloud applications executed on the same logical host.

U.S. Patent No. 7,822,841 (Claim 1)	
Patent Claim	Example Southwest Count I Systems and Services
	<p>Workload resources for managing pods</p> <p>Usually you don't need to create Pods directly, even singleton Pods. Instead, create them using workload resources such as <u>Deployment</u> or <u>Job</u>. If your Pods need to track state, consider the <u>StatefulSet</u> resource.</p> <p>Each Pod is meant to run a single instance of a given application. If you want to scale your application horizontally (to provide more overall resources by running more instances), you should use multiple Pods, one for each instance. In Kubernetes, this is typically referred to as <i>replication</i>. Replicated Pods are usually created and managed as a group by a workload resource and its controller.</p> <p>Source: https://kubernetes.io/docs/concepts/workloads/pods/.</p>
[1.f] wherein the monitoring system comprises a main monitor that operates to monitor the first and second clusters to identify the operation and connectivity problems and further comprises monitors for each node of the first and second clusters operating to check for hardware and software problems within a particular node and to report the hardware and software problems to the main monitor.	<p>Based on information and belief, the Southwest Count I Systems and Services include a computer system where the monitoring system comprises a main monitor that operates to monitor the first and second clusters to identify the operation and connectivity problems and further comprises monitors for each node of the first and second clusters operating to check for hardware and software problems within a particular node and to report the hardware and software problems to the main monitor.</p> <p>Kubernetes supports a Monitoring system (via Kubernetes API) with the functionality to monitor and manage Kubernetes clusters such as cluster's health, performance and identifying associated problems.</p>

Patent Claim

Example Southwest Count I Systems and Services

What is Kubernetes monitoring?

Simply put, Kubernetes monitoring is the practice of tracking the status of all components of a Kubernetes environment. Because there are **many pieces inside Kubernetes**, Kubernetes monitoring actually entails monitoring many distinct things, such as:

U.S. Patent No. 7,822,841 (Claim 1)	
Patent Claim	Example Southwest Count I Systems and Services
	<p>Kubernetes works with metrics pipeline/monitoring pipeline features, that provide monitoring operations within Kubernetes clusters including monitoring software and hardware problems. Kubernetes supports monitoring functionalities for containers, pods, services, nodes, and a cluster itself.</p> <h2>Tools for Monitoring Resources</h2> <p>To scale an application and provide a reliable service, you need to understand how the application behaves when it is deployed. You can examine application performance in a Kubernetes cluster by examining the containers, pods, services, and the characteristics of the overall cluster. Kubernetes provides detailed information about an application's resource usage at each of these levels. This information allows you to evaluate your application's performance and where bottlenecks can be removed to improve overall performance.</p> <p>In Kubernetes, application monitoring does not depend on a single monitoring solution. On new clusters, you can use resource metrics or full metrics pipelines to collect monitoring statistics.</p> <p>Source: https://kubernetes.io/docs/tasks/debug/debug-cluster/resource-usage-monitoring/.</p> <p>A full metrics pipeline gives you access to richer metrics. Kubernetes can respond to these metrics by automatically scaling or adapting the cluster based on its current state, using mechanisms such as the Horizontal Pod Autoscaler. The monitoring pipeline fetches metrics from the kubelet and then exposes them to Kubernetes via an adapter by implementing either the <code>custom.metrics.k8s.io</code> or <code>external.metrics.k8s.io</code> API.</p> <p>Kubernetes is designed to work with OpenMetrics, which is one of the CNCF Observability and Analysis - Monitoring Projects, built upon and carefully extending Prometheus exposition format in almost 100% backwards-compatible ways.</p> <p>Source: https://kubernetes.io/docs/tasks/debug/debug-cluster/resource-usage-monitoring/.</p>

U.S. Patent No. 7,822,841 (Claim 1)	
Patent Claim	Example Southwest Count I Systems and Services
	<p>What is Kubernetes monitoring?</p> <p>Simply put, Kubernetes monitoring is the practice of tracking the status of all components of a Kubernetes environment. Because there are many pieces inside Kubernetes, Kubernetes monitoring actually entails monitoring many distinct things, such as:</p> <ul style="list-style-type: none"> • The kube-system workloads. • Cluster information using the Kubernetes API. • Applications interactions with Kubernetes by monitoring apps bottom-up. <p>Source: https://www.groundcover.com/kubernetes-monitoring.</p> <p>Further, Kubernetes monitoring includes providing alerts to problems occurring within a cluster that enables troubleshooting and addressing other potential issues.</p> <p>By collecting Kubernetes data, you'll get viable information regarding your Kubernetes cluster health, that can help you perform Kubernetes troubleshooting and manage issues like unexpected container termination. You can also leverage the data for proactive decisions such as adjusting rate limits.</p> <p>Source: https://www.groundcover.com/kubernetes-monitoring.</p> <p>As mentioned above, the Kubernetes API enables monitoring of the clusters. This can act as the main monitoring system and can monitor multiple Kubernetes clusters.</p>

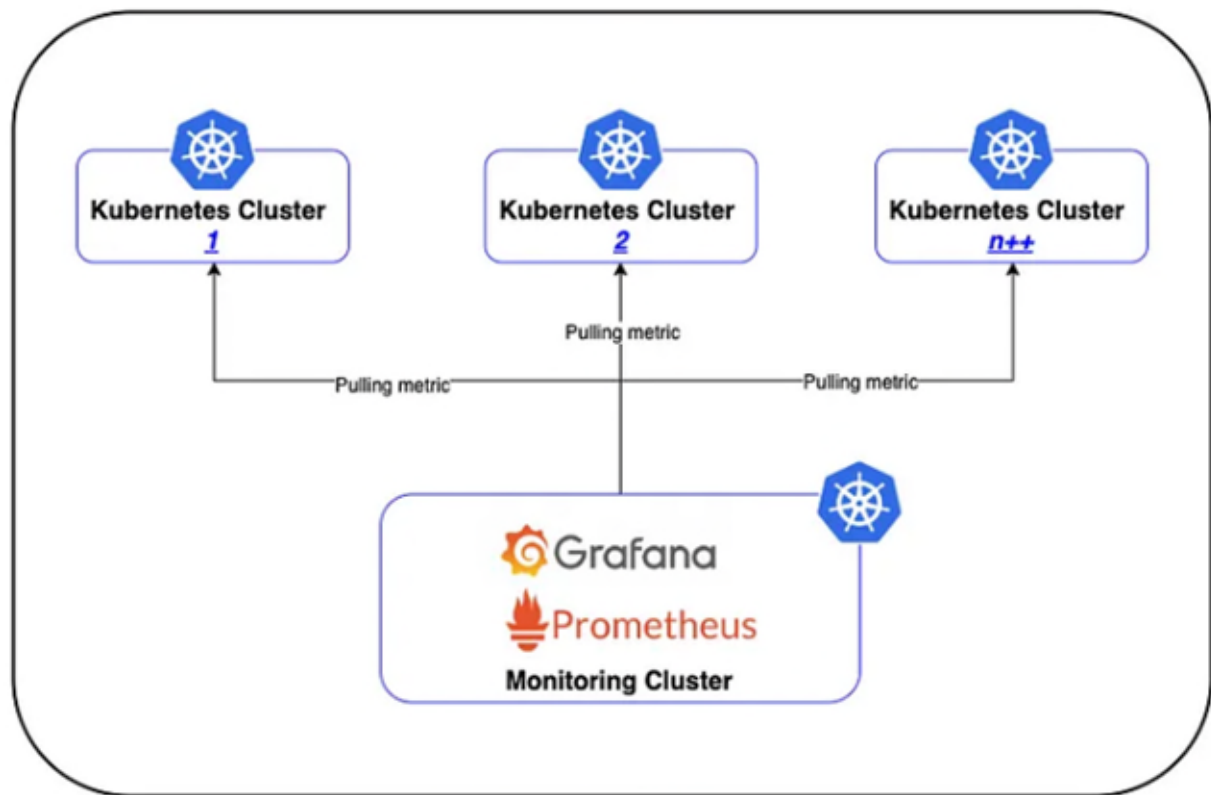

U.S. Patent No. 7,822,841 (Claim 1)	
Patent Claim	Example Southwest Count I Systems and Services
	<p>Kubernetes alerting is the practice of generating notifications for events or trends in Kubernetes that require admins' attention. Examples of such events and trends include:</p> <ul style="list-style-type: none"> • A node that has failed. • A Pod that is stuck in the pending state. • A container or Pod that is consuming a high level of resources relative to normal consumption trends. • High latency rates for communication between Kubernetes cluster components (such as between kubelet and control plane nodes). <p>Source: https://www.groundcover.com/kubernetes-monitoring/kubernetes-alerting.</p> <p>Further, Kubernetes using API for cluster monitoring and kubelets for monitoring at node level, Kubernetes also supports additional third-party open source monitoring tools such as, Grafana, Prometheus, and/or FluentD.</p>

U.S. Patent No. 7,822,841 (Claim 1)	
Patent Claim	Example Southwest Count I Systems and Services
	<h2>Setting up monitoring in Kubernetes</h2> <p>Monitoring is a crucial aspect of effectively managing Kubernetes clusters. By setting up comprehensive monitoring, you can gain insights into your cluster's health, performance, and resource utilization, enabling you to address issues and optimize your infrastructure proactively. Several monitoring solutions are available for Kubernetes, including open-source tools like Prometheus, Grafana, and Alertmanager and commercial options like Datadog and New Relic.</p> <p>Choose a solution that aligns with your requirements and budget. Setting up Prometheus and Grafana for monitoring your Kubernetes cluster is a common choice and can provide a robust monitoring solution. The following are detailed steps for setting up Prometheus, Grafana, and FluentD, three common monitoring components, assuming that a Kubernetes cluster is already up and running:</p> <ul style="list-style-type: none"> ■ Prometheus: A monitoring tool built for aggregating metrics in containers that can be used for setting up alerts. ■ Grafana: A monitoring tool that can be used to visualize Prometheus data. ■ FluentD: A tool for aggregating a system's logs into one source. <p>Source: https://www.apptio.com/topics/kubernetes/monitoring/.</p>
